

CS 639: Deep Learning for Computer Vision, Spring 2024

Problem Set 1

Instructor: Yong Jae Lee (yongjaelee@cs.wisc.edu)

TA: Zhuoran Yu (zhuoran.yu@wisc.edu)

TA: Zeyi Huang (zhuang479@wisc.edu)

Due: Thursday, February 22nd, 11:59 PM

Instructions

1. Download the zipped assignment file from Canvas.
2. Once you unzip the downloaded content, please upload the folder to your Google Drive. Then, open each *.ipynb notebook file with Google Colab by right-clicking the *.ipynb file. No installation or setup is required. For more information, please see this tutorial on [using Colab](#).
3. Next, we recommend editing your *.py file on Google Colab, set the ipython notebook and the code side by side. Work through the notebook, executing cells and implementing the codes in the *.py file as indicated. You can save your work, both *.ipynb and *.py, in Google Drive (click “File” -> “Save” or press “Ctrl/Cmd + s”) and resume later if you don’t want to complete it all at once.
4. While working on the assignment, keep the following in mind:
 - The notebook and the python file have clearly marked blocks where you are expected to write code. **Do not write or modify any code outside of these blocks.**
 - **Do not add or delete cells from the notebook.** You may add new cells to perform scratch computations, but you should delete them before submitting your work.
 - **Run all cells, and do not clear out the outputs, before submitting.** You will only get credit for code that has been run.
5. Once you have completed a notebook, download the completed uniqueid_PS1.zip file, which is generated from your last cell of the fully_connected_networks.ipynb file. Submit this to Canvas. Note that only one person from the group will need to do this.
6. **You may complete the assignment individually or with a partner (i.e., maximum group of 2 people). If you worked with a partner, provide the name of your partner in the *.ipynb file. We will be using MOSS to check instances of plagiarism/cheating.**

The goal of this assignment is for you to learn how to use KNN classifier, linear layer, softmax function, and fully connected layers so that you can

- Develop proficiency with training and evaluation pipeline in machine learning.
- Gain experience using forward function and backward propagation.

The notebook `knn.ipynb`, `linear_classifier.py`, `fully_connected_networks.py` will walk you through those pipelines in PyTorch. You are required to write code on `knn.py`, `linear_classifier.py`, `fully_connected_networks.py`.¹

[OPTIONAL] Extra credit short answer problems [up to 0.5% each added to final class score]

Save your answers into a PDF, and submit it together with your code to Canvas.

1. Describe two advantages that the softmax cross-entropy loss has over the SVM loss.
2. Why is the bias term needed in linear classifiers?

¹ The coding assignment is adapted from Stanford CS 231n.
